Art Unit: 3753

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on May 18, 2010 has been entered.

Claims 1-5, 7-8, 11-14, and 18-28 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected invention, there being no allowable generic or linking claim. Applicant timely traversed the restriction (election) requirement in the reply filed on April 20, 2009.

The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claims 6, 15, and 17 are rejected under 35 U.S.C. 102(b) as being anticipated by Gold, of record.

Gold shows a valve with main ports 11, 12 and other ports 13, 14 and a valve spool with base 28, disc-like member 29 with openings 32, and a diametral wall 30. In the normal position, shown in dash lines in Figure 1, a flow path will exist from the spool through openings 32 to a chamber region above 29, returning back through openings 32 to the spool and to the other port 14 through an opening on the cylindrical wall of the valve chamber. Each of the ports of Gold include a transfer or intermediate chamber. The chamber region is located between member 29 and cover 39.

Art Unit: 3753

Applicant's arguments have been fully considered but they are not persuasive. Applicant argues that the openings 32 are for pressure equalizing the spool and there will be no flow from the chamber region to a transfer chamber. The Examiner disagrees with Applicant's conclusion. If fluid is present above member 29 then it must have flowed there. The only source of fluid is that applied to the ports. There is an unobstructed fluid path from a transfer chamber through the spool and through an opening 32 to the chamber region. This fluid path corresponds identically to what is disclosed in the instant application, and fairly responds to the language of claim 6.

Applicant argues that the pressure chamber above member 29 is not a transfer chamber. The Examiner agrees. The pressure chamber of Gold corresponds to the chamber region. The transfer chambers of Gold are the squarish chambers between the lines 15-18 and the spool.

Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gold in view of Kirkwood et al.

Gold teaches the claimed valve except for a seal. Kirkwood et al show a similar four port valve with a seal. It would have been obvious at the time the invention was made for one of ordinary skill in the art to have used such a seal in the valve of Gold to similarly seal against the chamber wall.

Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gold in view of Voith.

Gold teaches the claimed valve except for a lower bearing. Voith shows a similar valve with a lower bearing, as recited. It would have been obvious at the time the

Art Unit: 3753

invention was made for one of ordinary skill in the art to have used such a bearing as taught by Voith in the valve of Gold to similarly provide for rotational stability.

Claims 6 and 16 are rejected under 35 U.S.C. 102(b) as being anticipated by Bergman.

Bergman shows a valve with main ports 1, 2 and other ports 3,4, and a valve spool with base 17, disc-like member 16 with openings opposite valves 28, 29, a diametral wall 15 and a radial wall 14 which is read as extending from the wall 15. As with Gold, a flow path exists as recited through the openings in member 16 to an other port.

Applicant's arguments have been fully considered but they are not persuasive. Applicant argues that the Examiner has read the hollow members 30 as wall openings. However, the Office Action reads "Accordingly, the cylindrical shape of the seals 30 are properly read as a wall with openings therethrough." It is believed that the Examiner's position was sufficiently clear that it could be understood, since the openings at issue allow fluid flow between the ports and the spool, which is clearly present in Bergman. Accordingly, the rejection will be maintained.

All claims are drawn to the same invention claimed in the application prior to the entry of the submission under 37 CFR 1.114 and could have been finally rejected on the grounds and art of record in the next Office action if they had been entered in the application prior to entry under 37 CFR 1.114. Accordingly, THIS ACTION IS MADE

FINAL even though it is a first action after the filing of a request for continued

Art Unit: 3753

examination and the submission under 37 CFR 1.114. See MPEP § 706.07(b).

Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to John Fox whose telephone number is 571-272-4912. The examiner can normally be reached on Monday-Saturday from 10am-6pm (Hoteling Program).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Robin Evans can be reached on 571-272-4777. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
